## PhD RESEARCH PROJECT

**Objective:** To investigate the modulatory role of statin treatment in murine model of obesity.

**Findings:** The study was performed in two animal models; first was HFD (pellets, *ad libitum*) for 1 week baseline study followed by 21 days drug treatment i.e. rosuvastatin (2.5, 5 & 10 mg/kg, p.o.), pitavastatin (0.5, 1 & 3 mg/kg, p.o.). Second model was MSG (4 g/kg, sc for 7 alternate postnatal days i.e. 2<sup>nd</sup> to 14<sup>th</sup>) for 6 weeks i.e. 42 days baseline study followed by 28 days drug treatment with RSV (2.5 & 10 mg/kg, p.o.), PTV (0.5 & 3 mg/kg, p.o.). The study demonstrated that RSV and PTV

prevent excessive body weight gain, as well as reduce the high-fat diet increased body weight. In addition, there was significant decrease in visceral fat pad weight (epididymal, retroperitoneal & perirenal adipose tissues). The results of the study suggest that RSV and PTV caused significant adipocytes loss, reduced leptin and insulin levels. In consistent with improvement of lipid profile and insulin sensitivity, RSV and PTV were also be able to attenuate the development of hypertension in obese rats. Further, RSV and PTV reduced the levels of hepatic and cardiac TBARS and free radical generation and enhance the levels of antioxidants i.e. glutathione (GSH), glutathione peroxidase (GPx), glutathione reductase (GR), glutathione-S-transferase (GST), superoxide dismutase (SOD) and catalase (CAT)]. The effects of RSV and PTV was comparable to the standard drug Orlistat (reversible pancreatic lipase inhibitor) (10 mg/kg, p.o.), however the effect of PTV was more significant compared to RSV. The study strongly supports the potential of rosuvastatin and pitavastatin in the management of obesity disorder as a pleiotropic effect.

## M. PHARM. RESEARCH PROJECT

**Objective:** To evaluate the hepatoprotective potential of fruit of *Tribulus terrestris* linn. on acetaminophen-induced liver damage in rats.

**Findings:** The protective effects of methanolic extract of fruits of *Tribulus terrestris* L. (METT) was evaluated in acetaminophen (AA)-induced liver damage in rats as a 7 days acute study. The test group METT (500 mg/kg, p.o.) and the standard group Silymarin (100 mg/kg, p.o.) were treated respectively daily for 7 days to protect the liver from acetaminophen-induced hepatic damage. AA was administered as a single dose (2 g/kg, p.o.) on 5<sup>th</sup> day after regular administrations in AA control, TT test, and Silymarin standard groups to induce acute liver injury. Oral administration of TT (500 mg/kg) along with AA (2 g/kg) showed a significant decrease in serum enzymes aspartate aminotransferase (AST), alanine aminotransferase (ALT), total bilirubin, direct bilirubin and alkaline phosphatase (ALP) levels with a decrease in total protein levels. The same was supported by histopathological studies of liver. The results of test group were comparable with the standard group. Based on the findings, the study for the first time reported that the methanolic extract of TT protects the liver from AA-induced liver damage. Responsible leads for our present hepatoprotective studies are flavonoids as of Silymarin.
