ON

DESIGN THINKING IN ARCHITECTURAL EDUCATION

SEP 25 - OCT 9, 2023

PREAMBLE

Design thinking is a valuable approach in architectural education, as it equips with essential skills and mindsets for tackling complex design challenges.

The design process in architecture deals with complex, contradicting, and problematic issues. It requires and employs a wide range of information, adopts critical and creative thinking techniques, generates multiple and alternate ideas, and identifies the appropriate solution for a design problem. Design thinking refers broadly to all of the cognitive activities that designers employ in operating the design process to generate ideas, solve problems, and make decisions.

Design Thinking encourages collaboration between architects, urban planners, engineers, social scientists, and other experts. It challenges us to think beyond silos, seeking solutions that address the intricate web of issues that architectural projects inevitably encounter. Design Thinking guides us to uncover the unique qualities of each site and community, promoting sustainability and harmonious integration with the existing fabric.
